

TOOLS FOR THE NATIONAL PARK SERVICE

Add the excitement of citizen science to your evening programs.

Introducing the professional research tool that turns park visitors into citizen scientists.

Echo Meter Touch from Wildlife Acoustics is an innovative, affordable combination of hardware and software that transforms iPads, iPhones and iPod touch devices into bat detectors.

Add bat walks to your evening programs, and your visitors will learn about the world around them. They'll actually hear the bats' ultrasonic calls, and see the calls on a beautiful high-resolution spectrogram – all in real-time. Echo Meter Touch even identifies the species of bat being detected. They can record it all and share the files – inspiring other citizen scientists in their communities.

So when you're considering new ideas for your evening programs, consider bat walks made possible by Echo Meter Touch.
